Suggested Answers to 2016 O level Science Chemistry 5076/5077/5078 Paper 5

In the 2016 Science (Chemistry) practicals, 3 solutions (sodium carbonate, hydrochloric acid and silver (II) nitrate) were given. The 3 solutions were labelled as P, Q and R in no particular order. Students were required to identify the unknown solutions. Additional information: Most metal carbonates are insoluble in water except Group 1 metal carbonates.

Experiment 1

Instruction	Observation	Teacher's Comment
Add P to Q	Yellow-grey ppt	Since no effervescence was seen, this is not a reaction between HCl and sodium carbonate. The yellow-grey ppt could be silver carbonate with some elemental silver.
Add R	White ppt. Effervescence.	Silver carbonate reacts with HCl to give silver chloride (white ppt) but the effervescence stops very quickly as the silver chloride forms a protective layer on the remaining silver carbonate, preventing further reaction. Therefore, R could be HCl.
Add R to P	White ppt	Since no effervescence was seen, this is not a reaction between HCl and sodium carbonate. If R is HCl, then P must be silver (II) nitrate. Since silver nitrates produce a white ppt with chlorides, this could be a reaction between AgNO ₃ & HCl.
Add Q	White ppt remains. Effervescence. Gas evolved gives white ppt with limewater.	Based on the above observation, a reaction between AgNO ₃ & HCl will produce AgCl (white ppt) & HNO ₃ . The nitric acid produced reacts with Q (sodium carbonate) to give off carbon dioxide gas and sodium nitrate which is highly soluble in water.
Add Q to R	No ppt. Effervescence. Gas evolved gives white ppt with limewater.	HCI (R) reacts with sodium carbonate (Q) to give off carbon dioxide gas and sodium chloride.
Add P	White ppt	Sodium chloride reacts with silver (II) nitrate (P) in a precipitation reaction to produce AgCl (white ppt) and sodium nitrate which is highly soluble in water.

Experiment 2

Add copper (II) sulphate to solutions P, Q & R respectively. Heat for 5 minutes without vigorous boiling. Record all observations and test for any gases produced.

Instruction	Observation	Teacher's Comment
Add 1 cm ³ of P to 1 cm ³ of copper (II) sulphate and heat strongly.	Blue solution with white ppt.	Copper sulphate reacts with silver (II) nitrate (P) in a precipitation reaction to produce Ag ₂ SO ₄ (white ppt) and copper nitrate solution (blue solution).
Add 1 cm ³ of Q to 1 cm ³ of copper (II) sulphate and heat strongly.	Green ppt	Copper sulphate reacts with sodium carbonate (Q) in a precipitation reaction to produce CuCO ₃ (green ppt) and sodium sulphate solution.
Add 1 cm ³ of R to 1 cm ³ of copper (II) sulphate and heat strongly.	No visible change	Acidified copper sulphate

Use your observations from the two experiments to identify P, Q & R and provide evidence to support your answer.

Substance	Identity	Evidence
Р	silver (II) nitrate	Only silver nitrate produces a white ppt and a blue solution when added to copper sulphate and a white ppt when added to aqueous sodium chloride.
Q	sodium carbonate	Produces a green ppt when added to copper sulphate and gives off carbon dioxide when added to nitric acid.
R	hydrochloric acid	Produces no visible change when added to copper sulphate and reacts with Q to give off carbon dioxide gas.

Q: Write a chemical equation for the reaction between silver (II) nitrate and copper(II) sulphate.

$$2AgNO_3(aq) + CuSO_4\left(aq\right) \rightarrow Ag_2SO_4\left(s/aq\right) + Cu(NO_3)_2\left(aq\right)$$

Teacher's comment: Ag_2SO_4 is sparingly soluble. Hence, the state symbols can be recorded as (aq) according to the syllabus or as (s) according to the observations.

PENCILTUTOR SCHOOL (PTE) LTD. CO. REG. NO. 200601708E BLK 102, #02-135 YISHUN AVENUE 5 SINGAPORE 760102

Q: Explain any other changes you saw but did not record. Give an explanation on how you arrived at your answer.

In Experiment 1, although I saw effervescence, I was not able to test for the gas evolved when R was added to the yellow ppt formed after Q was added to R.

Use information in Teacher's comment to give your explanation.
